

Banking & Financial Glossary

ABIX Data Explorer — Financial Metrics, Ratios, Algorithms & Banking Concepts in Algeria

This document provides the comprehensive methodological reference for all accounting aggregates, formulas, and statistical methods implemented in the ABIX Data Explorer platform across the 21 commercial banks in Algeria.

Scope: 21 Commercial Banks in Algeria	Indexed Terms: 52 concepts
Edition: 2025 / 2026	Export Date: 2026-08-26
Publisher: Tadjeddine & Partners	Standard: Deterministic & Auditable

Summary of the 8 Analytical Categories

• Financial & Balance Sheet Indicators	8 terms
• Ratios & Profitability	8 terms
• Risk, Solvency & Prudential	8 terms
• Liquidity & Intermediation	7 terms
• Statistics & Quantitative Methods	11 terms
• Sector & Market Analysis	4 terms
• Concentration & Competition	3 terms
• ABIX Methodology & Framework	3 terms

FINANCIAL & BALANCE SHEET INDICATORS

Total Assets (Balance Sheet Total) (TB)

Unit: Mds DZD | ♦ Contextual interpretation

Measures the overall balance sheet scale of a bank by summing all its assets as of December 31.

Total Assets represents total closing accounting assets. In ABIX Data Explorer, it serves as the benchmark aggregate for market share calculations, bank size grouping, and sector weighting.

ABIX FORMULA:

Total Bilan = Caisse & Banques centrales + Titres & Bons du Trésor + Crédits clientèle + Autres actifs

Interpretation: An indicator of relative size and institutional presence. It does not by itself measure profitability or solvency.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Consolidated sector total assets of approx. 18,500 billion DZD, ~87% held by public banks.

ABIX Modules: Vue Secteur, Classements, Profil Banque, Historique, Parts de marché, Executive Dashboard

Customer Deposits (DEP)

Unit: Mds DZD | ♦ Contextual interpretation

Total financial resources entrusted to the bank by customers in checking, term, or savings accounts.

Customer deposits aggregate demand, term, savings, and collateral deposits from households, corporates, and institutions. They represent the primary funding base for intermediation.

ABIX FORMULA:

Dépôts = Dépôts à vue + Dépôts à terme + Livrets d'épargne + Autres dépôts clientèle

Interpretation: Measures funding capture and customer loyalty. A high share of demand deposits lowers overall cost of funding.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Total deposit volume of 14,200 billion DZD.

ABIX Modules: Vue Secteur, Classements, Profil Banque, Historique, Parts de marché, Comparateur

Customer Loans (CRE)

Unit: Mds DZD | ♦ Contextual interpretation

Total outstanding financings and credit facilities granted to the economy (enterprises, professionals, retail).

Represents total gross lending facilities extended by the bank across overdrafts, corporate working capital, equipment loans, mortgages, and consumer credit.

ABIX FORMULA:

Crédits = Crédits d'exploitation + Crédits d'investissement + Crédits immobiliers + Crédits aux particuliers

Interpretation: Reflects the bank's active contribution to economic financing and counterparty risk exposure.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Gross customer loans of 11,100 billion DZD.

ABIX Modules: Vue Secteur, Classements, Profil Banque, Historique, Parts de marché, Comparateur

Accounting Equity (FP)

Unit: Mds DZD | ▲ Higher generally better

Stable resources belonging to shareholders, comprising share capital, reserves, and retained earnings.

Accounting Equity represents the net book value on the balance sheet. It acts as the financial cushion against unexpected losses. ABIX note: book equity is distinct from regulatory capital (Tier 1/Tier 2) under Bank of Algeria Regulation 2014-01.

ABIX FORMULA:

Fonds Propres = Capital social + Primes d'émission + Réserves + Report à nouveau + Résultat net

Interpretation: A high equity buffer enhances financial autonomy and shock absorption capacity.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector accounting equity of 2,450 billion DZD.

ABIX Modules: Vue Secteur, Profil Banque, Classements, Scores ABIX (Capitalisation)

Net Banking Income (PNB)

Unit: Mds DZD | ▲ Higher generally better

Gross banking operational margin measuring revenue creation before operating expenses.

NBI is the banking equivalent of gross revenue. It consists of net interest income, net fee and commission income, and net trading and FX gains.

ABIX FORMULA:

PNB = (Intérêts reçus – Intérêts versés) + (Commissions reçues – Commissions payées) + Gains de change & titres

Interpretation: Reflects commercial dynamism and the bank's capacity to monetize intermediation and payment services.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector Net Banking Income of 430 billion DZD.

ABIX Modules: Vue Secteur, Profil Banque, Classements, Scores ABIX (Dynamique), Historique

Gross Operating Income (RBE)

Unit: Mds DZD | ▲ Higher generally better

Surplus generated by core operations after deducting general operating expenses and depreciation.

GOI measures the pure operational profitability before credit risk provisions and non-recurring items. It equals NBI minus operating costs and depreciation.

ABIX FORMULA:

RBE = Produit Net Bancaire – Frais généraux d'exploitation – Dotations aux amortissements

Interpretation: A solid and growing GOI demonstrates disciplined cost management relative to commercial revenue.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector Gross Operating Income of 245 billion DZD.

ABIX Modules: Vue Secteur, Profil Banque, Classements, Scores ABIX (Efficience)

Net Profit (Net Income) (RN)

Unit: Mds DZD | ▲ Higher generally better

Bottom-line profit or loss attributable to the bank after credit risk provisions and corporate taxes.

Net Income represents final net earnings after cost of risk (loan provisions), corporate income tax (IBS), and non-operating gains/losses.

ABIX FORMULA:
Résultat Net = RBE – Coût net du risque (Provisions nettes) + Résultat exceptionnel – Impôts (IBS)

Interpretation: Ultimate measure of financial return. It directly builds equity through retained earnings or funds dividend distribution.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Consolidated sector net profit of 185 billion DZD.

ABIX Modules: Vue Secteur, Profil Banque, Classements, Scores ABIX (Rentabilité), Historique

Treasury Securities & Sovereign Bonds (BDT)

Unit: Mds DZD | ♦ Contextual interpretation

Outstanding stock of sovereign debt securities issued by the Algerian Treasury held by the bank.

Includes short-term and medium/long-term sovereign paper issued by the State Treasury. In Algeria, Treasury paper represents a core asset allocation pillar. Prudential note: Sovereign exposures may benefit from preferential prudential treatment in accordance with applicable regulatory frameworks and qualifying criteria.

ABIX FORMULA:
Bons du Trésor = Bons du Trésor à Court Terme + Bons du Trésor à Moyen et Long Terme + Titres assimilés

Interpretation: A high share reflects a conservative asset allocation strategy or surplus liquidity invested in sovereign debt.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector Treasury securities portfolio of 3,800 billion DZD.

ABIX Modules: Vue Secteur, Profil Banque, Classements, Historique, Allocation d'actifs

RATIOS & PROFITABILITY

Return on Equity (ROE) (ROE)

ABIX Benchmark | Unit: % | ▲ Higher generally better

Ratio of net income to closing equity, measuring financial return generated for shareholders.

In ABIX Data Explorer, standard ROE is calculated by dividing net profit by closing book equity as of December 31. It measures the return generated on invested capital. Methodology note: for multi-year dynamic analyses, refer also to ROAE based on average equity.

ABIX FORMULA:
ROE = (Résultat Net ÷ Fonds Propres de clôture) × 100

Interpretation: A higher ROE reflects strong financial profitability, but must be evaluated alongside leverage and underlying risk profile.

ABIX Comfort Benchmark: Modéré < 8 %, Standard sectoriel 8-15 %, Élevé > 15 %

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector median ROE of 9.8%, ranging from 3.5% to over 22%.

ABIX Modules: Vue Secteur, Classements, Profil Banque, Scores ABIX (Rentabilité), Matrice Rentabilité vs Risque

Return on Average Equity (ROAE) (ROAE)

ABIX Benchmark | Unit: % | ▲ Higher generally better

Ratio of net income to average equity between the beginning and end of the fiscal year.

ROAE neutralizes intra-year capital variations (equity injections, dividend payouts). It provides a refined economic measurement of returns on capital employed throughout the year.

ABIX FORMULA:

$$ROAE = [Résultat Net \div ((Fonds Propres t + Fonds Propres t-1) \div 2)] \times 100$$

Interpretation: Preferred for rigorous multi-year analysis when material intra-year equity changes occur.

ABIX Comfort Benchmark: Standard sectoriel 8-15 %

Concrete example: 2024 data, ABIX 2025 edition, constant scope: For 12B DZD profit and equity moving from 100B to 120B DZD, ROAE is 10.9% (vs 10.0% closing ROE).

ABIX Modules: Profil Banque (Analytique), Comparateur Avancé

Return on Assets (ROA) (ROA)

ABIX Benchmark | Unit: % | ▲ Higher generally better

Ratio of net income to closing total assets, measuring overall asset productivity.

In ABIX Data Explorer, ROA is computed on closing balance sheet assets as of December 31. It measures the bank's ability to generate earnings per unit of asset managed.

ABIX FORMULA:

$$ROA = (Résultat Net \div Total Bilan de clôture) \times 100$$

Interpretation: A key indicator of operational profitability. In banking, a ROA above 1.5% reflects strong underlying earning power.

ABIX Comfort Benchmark: Modéré < 0,8 %, Moyen 0,8-1,5 %, Élevé > 1,5 %

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector average ROA of 1.12%, with peaks above 2.5% among private specialized institutions.

ABIX Modules: Vue Secteur, Classements, Profil Banque, Scores ABIX (Rentabilité), Matrice 4 Quadrants

Return on Average Assets (ROAA) (ROAA)

ABIX Benchmark | Unit: % | ▲ Higher generally better

Ratio of net income to average total assets across the fiscal year.

ROAA smooths out intra-year balance sheet expansions (rapid deposit growth, refinancing). It represents the academic standard for measuring asset efficiency over time.

ABIX FORMULA:

$$ROAA = [Résultat Net \div ((Total Bilan t + Total Bilan t-1) \div 2)] \times 100$$

Interpretation: International benchmark standard to neutralize year-end balance sheet seasonality.

ABIX Comfort Benchmark: Standard sectoriel 0,8-1,5 %

Concrete example: 2024 data, ABIX 2025 edition, constant scope: 5B DZD profit on assets expanding from 400B to 500B DZD: ROAA is 1.11% (vs 1.00% closing ROA).

ABIX Modules: Profil Banque, Comparateur Avancé

Cost-to-Income Ratio (CIR) (CIR)

ABIX Benchmark | Unit: % | ▼ Lower generally better

Share of Net Banking Income consumed by operating overhead and depreciation.

The CIR measures operational efficiency. A lower ratio indicates higher operational productivity in converting revenues to gross profit. In ABIX scoring models, it operates as an inverted metric (lower is better).

ABIX FORMULA:

Coefficient d'Exploitation = $[(\text{Frais généraux} + \text{Amortissements}) \div \text{Produit Net Bancaire}] \times 100$

Interpretation: A lower ratio reflects lean operations. A ratio above 60-65% indicates elevated structural overhead.

ABIX Comfort Benchmark: Excellente efficience < 40 %, Moyen 40-55 %, Faible efficience > 60 %

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector median CIR of 43.5%, top-tier efficient banks standing below 35%.

ABIX Modules: Vue Secteur, Classements, Profil Banque, Scores ABIX (Efficience), Historique

Net Interest Margin (NIM) (NIM)

ABIX Benchmark | Unit: % | ▲ Higher generally better

Ratio of net interest income earned to interest-earning assets.

NIM measures the core spread profitability of financial intermediation. ABIX methodology note: Where detailed average earning assets are not homogeneously reported across all banks, ABIX applies the NBI / Total Assets proxy ratio.

ABIX FORMULA:

NIM théorique = $(\text{Marge d'intérêt nette} \div \text{Actifs productifs moyens}) \times 100$ | **Proxy ABIX** = $(\text{PNB} \div \text{Total Bilan}) \times 100$

Interpretation: A healthy margin reflects loan pricing discipline combined with low-cost customer funding.

ABIX Comfort Benchmark: Standard sectoriel 2,0-3,5 %

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector average NBI / Total Assets proxy of 2.35%.

ABIX Modules: Vue Secteur, Profil Banque, Historique

Net Profit Margin on NBI (NPM)

ABIX Benchmark | Unit: % | ▲ Higher generally better

Percentage of Net Banking Income successfully converted into final net profit.

Net Profit Margin assesses the overall capacity of the bank to retain revenues after operating costs, loan impairment provisions, and corporate taxes.

ABIX FORMULA:

Marge Nette sur PNB = $(\text{Résultat Net} \div \text{Produit Net Bancaire}) \times 100$

Interpretation: A higher margin indicates a highly profitable and resilient operating model.

ABIX Comfort Benchmark: Standard sectoriel 35-50 %

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector median net profit margin of 42.8%.

ABIX Modules: Vue Secteur, Profil Banque, Scores ABIX (Rentabilité)

GOI to Net Profit Conversion Rate (RBE_RN)

ABIX Benchmark | Unit: % | ▲ Higher generally better

Share of Gross Operating Income retained as net profit after credit risk provisions and taxes.

Measures the resilience of operational income against provisions and taxes. A conversion rate near 100% indicates that gross operating profit was not impaired by credit loss charges.

ABIX FORMULA:

$$\text{Taux de Conversion RBE} \rightarrow \text{RN} = (\text{Résultat Net} \div \text{RBE}) \times 100$$

Interpretation: A sharp drop signals an acceleration in credit loss provisioning or non-operating write-offs.

ABIX Comfort Benchmark: Standard sectoriel 65-85 %

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector median conversion rate of 75.5%.

ABIX Modules: Vue Secteur, Profil Banque, Scores ABIX (Efficience)

RISK, SOLVENCY & PRUDENTIAL

Capital Adequacy Ratio (CAR) (CAR)

Regulatory Standard | Unit: % | ▲ Higher generally better

Ratio of regulatory capital to risk-weighted assets (credit, market, operational risks).

Measures the prudential capital cushion against risk-weighted assets. Algerian regulatory framework: Pursuant to Bank of Algeria Regulation No. 2014-01 of February 16, 2014, mandatory requirements are: 1) Minimum global capital adequacy ratio: at least 9.5% of risk-weighted assets; 2) Tier 1 capital: at least 7.0% of risk-weighted assets. ABIX comfort benchmark: An indicative comfort range in the local market is generally situated between 14% and 18%.

ABIX FORMULA:

$$\text{Ratio de Solvabilité} = (\text{Fonds Propres Réglementaires Globaux} \div \text{Actifs Pondérés par les Risques}) \times 100$$

Interpretation: A ratio exceeding the 9.5% legal minimum confirms regulatory compliance. A very high ratio (> 20%) ensures maximum safety but may signal under-deployed credit capacity.

Mandatory Regulatory Framework: Solvabilité globale >= 9,5 % | Tier 1 >= 7,0 % (Règlement BA n° 2014-01)

ABIX Comfort Benchmark: Repère de confort ABIX >= 14-18 %

Concrete example: 2024 data, ABIX 2025 edition: Sector average CAR estimated at ~16.2%, well above the 9.5% regulatory floor.

ABIX Modules: Vue Secteur, Profil Banque, Scores ABIX (Solvabilité), Fiche Prudentielle

Tier 1 Capital Ratio (Tier1)

Regulatory Standard | Unit: % | ▲ Higher generally better

Ratio of highest quality core capital (paid-up capital and retained earnings) to risk-weighted assets.

Tier 1 ratio evaluates the bank's capacity to absorb immediate losses on a going-concern basis. Algerian regulation: BA Regulation No. 2014-01 mandates a minimum Tier 1 capital ratio of 7.0% of risk-weighted assets.

ABIX FORMULA:

$$\text{Ratio Tier 1} = (\text{Fonds Propres de Base Tier 1} \div \text{Actifs Pondérés par les Risques}) \times 100$$

Interpretation: A strong Tier 1 ratio ensures long-term viability without requiring emergency capital injections in stress scenarios.

Mandatory Regulatory Framework: >= 7,0 % (Règlement Banque d'Algérie n° 2014-01)

ABIX Comfort Benchmark: Repère de confort ABIX >= 11-14 %

Concrete example: 2024 data, ABIX 2025 edition: Average Tier 1 ratio of major Algerian banks estimated above 13.5%, compliant with regulations.

ABIX Modules: Profil Banque, Fiche Prudentielle

Non-Performing Loans Ratio (NPL Ratio) (NPL)

Market Reference | Unit: % | ▼ Lower generally better

Proportion of loans with payments past due (typically > 90 days) or presenting recognized default risk.

The NPL ratio is the primary indicator of asset quality. It measures impaired and doubtful loans relative to total gross credit portfolio. In ABIX, it is an inverted metric (lower is better).

ABIX FORMULA:

$$\text{Taux NPL} = (\text{Créances Non Performantes brutes} \div \text{Encours Total des Crédits bruts}) \times 100$$

Interpretation: A low ratio reflects strict underwriting standards and efficient recovery. A high ratio necessitates heavy provisioning that weighs on profit.

ABIX Comfort Benchmark: Qualité excellente < 4 %, Modérée 4-8 %, Vigilance > 10 %

Concrete example: Indicative sector data: Average sector NPL ratio around 10-12%, with marked divergence between public banks (legacy exposures) and private subsidiaries (often < 5%).

ABIX Modules: Profil Banque, Comparateur, Matrice Rentabilité vs Risque

NPL Coverage Ratio (COV)

Market Reference | Unit: % | ▲ Higher generally better

Ratio of accumulated loan loss provisions to total non-performing loans.

Assesses the degree of balance sheet protection against anticipated credit losses on impaired loans. A high coverage ratio means that the bulk of bad debt is already provisioned.

ABIX FORMULA:

$$\text{Taux de Couverture} = (\text{Stock de Provisions pour Dépréciation} \div \text{Encours Brut des NPL}) \times 100$$

Interpretation: A coverage ratio above 70-80% is widely regarded as a prudential comfort benchmark in emerging banking markets.

ABIX Comfort Benchmark: Couverture prudente recommandée >= 70-80 %

Concrete example: Methodological example: For 50B DZD in impaired loans with 40B DZD in cumulative provisions, the coverage ratio stands at 80.0%.

ABIX Modules: Profil Banque, Comparateur, Fiche Prudentielle

Provisioning Effort to Loans (Cost of Risk Proxy) (PROV_CRE)

ABIX Benchmark | Unit: % | ▼ Lower generally better

Annual net loan loss provisioning charges divided by total loan portfolio.

Serves as the direct proxy for cost of risk in ABIX Data Explorer. It measures the annual P&L; charge required to absorb credit deterioration across the loan book.

ABIX FORMULA:

$$\text{Effort de Provisionnement} = (\text{Dotations Nettes aux Provisions} \div \text{Encours des Prêts}) \times 100$$

Interpretation: A low and steady provisioning effort indicates disciplined underwriting and low default incidence.

ABIX Comfort Benchmark: Faible < 0,5 %, Moyen 0,5-1,2 %, Élevé > 1,5 %

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector median provisioning effort of 0.55% of total loans.

ABIX Modules: Vue Secteur, Profil Banque, Scores ABIX (Risque), Historique

Provision Burden on Gross Operating Income (PROV_RBE)

ABIX Benchmark | Unit: % | ▼ Lower generally better

Percentage of Gross Operating Income consumed by net credit loss provisioning charges.

Measures the proportion of operating income absorbed by credit loss provisioning. ABIX note: An increase may reflect deteriorating borrower quality or a proactive, conservative provisioning stance.

ABIX FORMULA:

$$\text{Pression Provisions} / \text{RBE} = (\text{Dotations Nettes aux Provisions} \div \text{RBE}) \times 100$$

Interpretation: A ratio below 20-25% preserves the bulk of operating surplus for net bottom-line profit.

ABIX Comfort Benchmark: Confortable < 20 %, Modéré 20-35 %, Pression forte > 40 %

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector median provision burden on GOI of 18.4%.

ABIX Modules: Vue Secteur, Profil Banque, Scores ABIX (Efficience & Risque)

Equity to Total Assets (Accounting Capitalization) (FP_TB)

ABIX Benchmark | Unit: % | ▲ Higher generally better

Share of the balance sheet financed by book equity.

Direct accounting metric of balance sheet equity backing. ABIX note: This is a simplified accounting capitalization ratio and does not substitute for regulatory solvency ratios based on risk-weighted assets (RWA).

ABIX FORMULA:

$$\text{Fonds Propres} / \text{Total Bilan} = (\text{Fonds Propres Comptables} \div \text{Total Bilan}) \times 100$$

Interpretation: A high ratio (> 12-15%) indicates strong capital backing and high financial safety.

ABIX Comfort Benchmark: Standard sectoriel 10-16 %

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector average ratio of 13.2%, reflecting strong equity backing.

ABIX Modules: Vue Secteur, Profil Banque, Scores ABIX (Capitalisation), Classements

Accounting Leverage (Assets / Equity) (LEV)

ABIX Benchmark | Unit: x | ♦ Contextual interpretation

Number of times total assets exceed the bank's book equity.

Measures balance sheet asset scale relative to equity backing. ABIX note: This is a simplified accounting leverage multiple and does not constitute the Basel III regulatory leverage ratio (which includes off-balance sheet items and prudential deductions).

ABIX FORMULA:

Levier Comptable = Total Bilan ÷ Fonds Propres Comptables

Interpretation: A moderate leverage (6x to 9x) ensures strong safety. Elevated leverage (> 15x) heightens solvency vulnerability.

ABIX Comfort Benchmark: Repère prudentiel indicatif 6x à 10x

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector median accounting leverage of 7.6x.

ABIX Modules: Vue Secteur, Profil Banque, Comparateur

LIQUIDITY & INTERMEDIATION

Loan-to-Deposit Ratio (LDR) (LDR)

Market Reference | Unit: % | ♦ Contextual interpretation

Proportion of customer deposits that is actively transformed and lent out as customer loans.

The LDR measures the bank's financial intermediation depth. It compares net loans to customer deposits. A balanced ratio ensures that lending is funded by stable customer deposits without excessive reliance on wholesale funding.

ABIX FORMULA:

Ratio Prêts / Dépôts = (Crédits Nets à la Clientèle ÷ Dépôts de la Clientèle) × 100

Interpretation: An LDR between 70% and 90% indicates balanced intermediation. Below 60%, resources are under-deployed; above 100%, the bank relies on external funding.

ABIX Comfort Benchmark: Sous-intermédiation < 60 %, Équilibré 70-90 %, Tension liquidité > 100 %

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector average LDR of 78.2%, reflecting solid deposit backing.

ABIX Modules: Vue Secteur, Profil Banque, Comparateur, Historique

Loans to Total Assets (CRE_TB)

Unit: % | ♦ Contextual interpretation

Percentage of total bank assets allocated to customer loans.

Reflects the bank's asset allocation profile. A high loan share characterizes a commercial lending bank, whereas a lower share indicates a sovereign paper or cash management focus.

ABIX FORMULA:

Prêts / Total Bilan = (Encours des Crédits Clientèle ÷ Total Bilan) × 100

Interpretation: Measures core lending intensity. A higher ratio correlates with greater revenue sensitivity to private credit risk.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector average loan share of total assets of 60.0%.

ABIX Modules: Vue Secteur, Profil Banque, Allocation d'actifs, Comparateur

Treasury Securities to Total Assets (BDT_TB)

Unit: % | ♦ Contextual interpretation

Percentage of total assets invested in sovereign debt securities issued by the Algerian State Treasury.

Measures the sovereign allocation weight within the asset base. Historically in Algeria, public banks hold material Treasury securities volumes from balance sheet restructuring and liquidity placements.

ABIX FORMULA:

$$\text{BDT} / \text{Total Bilan} = (\text{Encours des Bons du Trésor} \div \text{Total Bilan}) \times 100$$

Interpretation: A high ratio secures liquidity and sovereign coupon income, but may reflect relative crowding-out of private sector credit.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Average Treasury securities share of 20.5% of sector total assets.

ABIX Modules: Vue Secteur, Profil Banque, Allocation d'actifs

Deposits to Total Assets (Liabilities) (DEP_TB)

Unit: % | ♦ Contextual interpretation

Percentage of total balance sheet funded by customer deposits.

Measures the bank's structural reliance on customer deposits compared to other funding sources (equity, interbank borrowing, bond issues).

ABIX FORMULA:

$$\text{Dépôts} / \text{Total Bilan} = (\text{Dépôts de la Clientèle} \div \text{Total Bilan}) \times 100$$

Interpretation: A share above 75-80% characterizes a traditional commercial retail banking model with a granular, stable funding base.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector average deposit share of 76.8% of total liabilities.

ABIX Modules: Vue Secteur, Profil Banque, Historique

Other Assets (Residual Balance) (AA)

Unit: Mds DZD | ♦ Contextual interpretation

Portion of total assets not accounted for by customer loans and Treasury securities.

In ABIX balance sheet allocation models, Other Assets is the residual balance (Total Assets minus Loans minus Treasury Securities), encompassing cash, central bank reserves, interbank placements, fixed assets, and sundry accounts.

ABIX FORMULA:

$$\text{Autres Actifs} = \text{Total Bilan} - \text{Prêts clientèle} - \text{Bons du Trésor}$$

Interpretation: Enables full 100% balance sheet decomposition (Loans + Treasury + Other = 100%). A negative value flags potential data inconsistency.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector other assets volume of ~3,600 billion DZD (~19.5% of total assets).

ABIX Modules: Vue Secteur, Profil Banque, Allocation d'actifs

Liquidity Coverage Ratio (LCR) (LCR)

Regulatory Standard | Unit: % | ▲ Higher generally better

Bank capacity to withstand severe 30-day acute liquidity stress.

Compares high-quality liquid assets (HQLA) readily convertible to central bank cash against estimated 30-day net cash outflows under severe stress. Standard requirement: Minimum 100%.

ABIX FORMULA:

$$LCR = (\text{Stock d'Actifs Liquides de Haute Qualité HQLA} \div \text{Sorties Nettes de Trésorerie à 30j}) \times 100$$

Interpretation: An LCR above 100% ensures the bank holds sufficient liquid buffers to withstand deposit run-offs without emergency aid.

Mandatory Regulatory Framework: >= 100 % (Standard prudentiel de liquidité Bâle III)

ABIX Comfort Benchmark: Repère de confort >= 120 %

Concrete example: Normative example: For 120B DZD in HQLA and 80B DZD in 30-day modeled net outflows, LCR is 150% (exceeding 100% minimum).

ABIX Modules: Fiche Prudentielle, Comparateur

Net Stable Funding Ratio (NSFR) (NSFR)

Regulatory Standard | Unit: % | ▲ Higher generally better

Measures structural alignment between stable available funding and required illiquid assets over a 1-year horizon.

NSFR limits excessive reliance on short-term wholesale funding to finance long-term assets. It divides available stable funding (ASF) by required stable funding (RSF). Prudential standard: Minimum 100%.

ABIX FORMULA:

$$NSFR = (\text{Montant de Financement Stable Disponible ASF} \div \text{Financement Stable Exigé RSF}) \times 100$$

Interpretation: An NSFR above 100% confirms that long-term illiquid assets are funded by durable, sticky equity and deposits.

Mandatory Regulatory Framework: >= 100 % (Standard prudentiel de financement stable Bâle III)

ABIX Comfort Benchmark: Repère de confort >= 110 %

Concrete example: Methodological example: 200B DZD ASF covering 160B DZD RSF yields a solid 125% NSFR.

ABIX Modules: Fiche Prudentielle, Comparateur

STATISTICS & QUANTITATIVE METHODS

Arithmetic Mean (Average) (MOY)

Unit: selon indicateur | ♦ Contextual interpretation

Sum of all observed values divided by the total number of banks in the sample.

The arithmetic mean measures central tendency. In ABIX Data Explorer, it is computed strictly on available numeric observations (excluding nulls). It can be sensitive to extreme outliers in highly concentrated banking systems.

ABIX FORMULA:

$$\text{Moyenne} = (\sum X_i) \div N \text{ (pour } i = 1 \text{ à } N)$$

Interpretation: Provides the overall market level, but should be compared with the median to assess distributional skewness.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Sector mean ROE is 11.4% vs median of 9.8% (positive skew driven by top performers).

ABIX Modules: Vue Secteur, Classements, Profil Banque, Distribution Sectorielle

Median (50th Percentile / Q2) (MED)

Unit: selon indicateur | ♦ Contextual interpretation

Value separating the ordered sample of banks into two equal halves (50% above, 50% below).

The median is ABIX's primary robust central tendency metric because it is fully resistant to extreme outliers and public bank scale distortions. Exact formulation: 1) For an odd number N of banks (e.g. 21 banks in 2026): Median = central value at rank (N+1)/2; 2) For an even number N of banks (e.g. 20 banks in 2025): Median = arithmetic average of the two central values at ranks N/2 and (N/2)+1.

ABIX FORMULA:

Si N impair : Médiane = $X_{((N+1)/2)}$ | Si N pair : Médiane = $(X_{(N/2)} + X_{(N/2 + 1)}) \div 2$

Interpretation: Represents the performance of a typical median bank in Algeria without weighting bias towards giant public banks.

Concrete example: 2024 data, ABIX 2025 edition (20 banks, even N): Median CIR is the average of the 10th bank (43.2%) and 11th bank (43.8%), exactly 43.5%.

ABIX Modules: Vue Secteur, Classements, Profil Banque, Benchmarks & Quartiles, Executive Summary

Quartiles & Percentiles (Q1, Q2, Q3) (QUART)

Unit: selon indicateur | ♦ Contextual interpretation

Three statistical thresholds (Q1=25th, Q2=50th=Median, Q3=75th percentile) dividing the sector into four equal cohorts.

Descriptive quartile thresholds: 1) Q1 = 25th percentile; 2) Q2 = 50th percentile = Median; 3) Q3 = 75th percentile. ABIX engine computes percentiles using linear interpolation (N-1)*p. ABIX Performance Note: In ABIX executive restitution, the 'Q1' label is awarded to the top 25% best performers (e.g. highest ROE or lowest Cost-to-Income).

ABIX FORMULA:

Q1 = P25 (interpolation linéaire) | Q2 = Médiane (P50) | Q3 = P75 (interpolation linéaire)

Interpretation: Positions each bank objectively within its peer distribution tier without mean-driven distortion.

Concrete example: 2024 data, ABIX 2025 edition, sector ROE (20 banks): Q1 = 6.2%, Q2 = 9.8%, Q3 = 14.5%. Banks with ROE > 14.5% belong to the top performance quartile Q1.

ABIX Modules: Vue Secteur, Profil Banque, Distribution & Boxplots, Executive Dashboard, Heatmaps

Standard Deviation (σ) (SIGMA)

Unit: selon indicateur | ♦ Contextual interpretation

Statistical measurement of data dispersion around the arithmetic mean.

Quantifies the homogeneity or dispersion of banking metrics across institutions. Statistical note: In an approximately normal distribution, ~68% of observations fall within $\pm 1\sigma$ and ~95% within $\pm 2\sigma$ of the mean.

ABIX FORMULA:

Écart-type (σ) = $\sqrt{[(1 \div N) \times \sum (X_i - \bar{X})^2]}$

Interpretation: Evaluates mean representativeness and identifies outlier banks lying beyond 2 standard deviations.

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: For a mean ROE of 11.4% with sector σ = 5.2%, the range [6.2% - 16.6%] encompasses the core bank cohort.

ABIX Modules: Vue Secteur, Distribution Sectorielle, Outliers & Détection d'Anomalies

Coefficient of Variation (CV) (CV)

Unit: % | ♦ Contextual interpretation

Ratio of standard deviation to arithmetic mean, expressing relative dispersion as a normalized percentage.

The CV is a dimensionless metric enabling direct dispersion comparison across financial indicators with different units or scales (e.g. comparing deposits dispersion in billion DZD with ROE dispersion in %).

ABIX FORMULA:

$$\text{Coefficient de Variation (CV)} = (\text{Écart-type } \sigma \div \text{Moyenne arithmétique } X) \times 100$$

Interpretation: CV < 15% indicates strong sector homogeneity. CV > 30-50% indicates high dispersion and structural polarization.

Concrete example: 2024 data, ABIX 2025 edition: Cost-to-Income CV is 24% (moderate), whereas Total Assets CV reaches 145% (extreme scale skewness).

ABIX Modules: Vue Secteur, Distribution Sectorielle, Comparateur

Compound Annual Growth Rate (CAGR) (CAGR)

Unit: % | ▲ Higher generally better

Constant annual rate at which a metric would have grown from its base year to final year over n periods.

CAGR smooths out year-to-year volatility through geometric progression. In ABIX Data Explorer, CAGR is used in the Growth scoring pillar (25% weight each on Assets, Loans, NBI, and Net Profit).

ABIX FORMULA:

$$\text{CAGR} = [(\text{Valeur Finale} \div \text{Valeur Initiale})^{(1 \div n)} - 1] \times 100$$

Interpretation: Provides a standardized, fair multi-year growth comparison across institutions of varying scale.

Concrete example: 2021-2024 data, ABIX 2025 edition (constant scope): Sector loans expanded from 8,500B to 11,100B DZD over 3 years, representing a CAGR of +9.3% per annum.

ABIX Modules: Scores ABIX (Dynamique & Croissance), Historique Pluriannuel, Profil Banque

Year-over-Year Growth (YoY / Δ) (YoY)

Unit: % / pts | ♦ Contextual interpretation

Percentage change of a financial metric between period t and the preceding period t-1.

Measures annual metric expansion or contraction. In ABIX Data Explorer, for indicators already expressed as percentages (e.g. ROE, CIR), the variation is strictly tracked in percentage points (point_change).

ABIX FORMULA:

Pour agrégats (Mds DZD) : $\text{YoY} = [(V_t - V_{t-1}) \div V_{t-1}] \times 100$ | Pour ratios (%) : $\Delta = V_t - V_{t-1}$ (en points)

Interpretation: Identifies trend shifts, commercial accelerations, or abrupt year-over-year decelerations.

Concrete example: 2024 vs 2023 data, ABIX 2025 edition: Sector NBI grew by +8.2% YoY, while average ROE gained +0.6 percentage points.

ABIX Modules: Historique, Profil Banque, Vue Secteur, Scanning Déterministe

Rebased Index (Base 100) (B100)

Unit: indice (base 100) | ♦ Contextual interpretation

Index normalizing base year metric to 100 to visually compare growth trajectories across banks of differing sizes.

Base 100 fixes the initial selected year at 100. Subsequent years are computed as (Year Value / Base Value) * 100. This enables direct graphical trajectory comparison between large public and smaller private lenders.

ABIX FORMULA:
$$\text{Indice Base 100 (t)} = (\text{Valeur}_t \div \text{Valeur_base}) \times 100$$

Interpretation: An index of 135 indicates cumulative growth of +35% since the base year, regardless of initial bank size.

Concrete example: 2021-2024 data, ABIX 2025 edition (2021 base = 100): In 2024, sector deposits stand at 128.4 (+28.4% cumulative growth).

ABIX Modules: Historique, Compareur, Profil Banque

Pearson Linear Correlation (r) (PEARSON)

Academic Reference | Unit: coefficient (-1 à +1) | ♦ Contextual interpretation

Statistical measurement of the strength and direction of linear association between two financial metrics (-1 to +1).

The Pearson coefficient r ranges from -1 (perfect inverse linear relation) to +1 (perfect positive linear relation), with 0 indicating no linear association. Fundamental ABIX rule: Correlation ≠ Causation. Furthermore, r measures strictly linear relationships and can be sensitive to extreme outliers.

ABIX FORMULA:
$$r = \frac{\sum [(X_i - \bar{X})(Y_i - \bar{Y})]}{\sqrt{\sum (X_i - \bar{X})^2} \times \sqrt{\sum (Y_i - \bar{Y})^2}}$$

Interpretation: |r| > 0.70 indicates strong linear correlation; 0.40 < |r| < 0.70 moderate; |r| < 0.40 weak or non-linear association.

ABIX Comfort Benchmark: Forte correlation si |r| >= 0,70 (Seuil d'exclusion multicollinéarité ABIX: |r| >= 0,85)

Concrete example: 2024 data, ABIX 2025 edition, 20-bank scope: Strong positive linear correlation of r = +0.88 observed between Customer Deposits and Total Assets.

ABIX Modules: Matrice de Corrélation, Nuage de Points (Scatter Plots), Lab Méthodologique

Standardized Z-Score (Relative Positioning) (Z-SCORE)

Academic Reference | Unit: score (sans unité) | ♦ Contextual interpretation

Number of standard deviations separating a bank's metric from the sector mean (or median).

Standardizes metrics to a unitless scale centered at zero. ABIX implements two variants: 1) Classic Z = (X - Mean) / σ; 2) Robust Z = 0.6745 * (X - Median) / MAD. Statistical note: The equivalence of Z = +2 with the top 2.5% holds strictly only under the assumption of a normal distribution.

ABIX FORMULA:
$$Z \text{ classique} = (X - \bar{X}) \div \sigma \mid Z \text{ robuste} = 0,6745 \times (X - \text{Médiane}) \div \text{MAD}$$

Interpretation: Z = 0 places the bank at market center. Z > +2 or Z < -2 flags an outlier significantly diverging from sector norms.

ABIX Comfort Benchmark: Zone standard [-2 ; +2], Profil atypique si |Z| > 2

Concrete example: 2024 data, ABIX 2025 edition: A bank with 21.8% ROE against a sector mean of 11.4% (σ = 5.2%) achieves Z = +2.00.

ABIX Modules: Outliers & Détection d'Anomalies, Lab Méthodologique, Profil Banque

Min-Max Normalization (0-100 Scale) (MINMAX)

ABIX Benchmark | Unit: score (0 à 100) | ▲ Higher generally better

Linear transformation of a financial metric onto a standardized scale from 0 to 100 points.

Projects metrics onto a common 0-100 scale where 100 represents top performance. ABIX scoring rules: 1) Positive direction (higher is better, e.g. ROE, Solvency): $\text{Score} = [(X - \text{Min}) / (\text{Max} - \text{Min})] \times 100$; 2) Inverted direction (lower is better, e.g. CIR, NPL ratio): $\text{Score} = [(\text{Max} - X) / (\text{Max} - \text{Min})] \times 100$. Edge case: If Max equals Min, score defaults to 50.

ABIX FORMULA:

Sens direct : $\text{Score} = [(X - \text{Min}) \div (\text{Max} - \text{Min})] \times 100$ | Sens inverse : $\text{Score} = [(\text{Max} - X) \div (\text{Max} - \text{Min})] \times 100$

Interpretation: Enables aggregation and direct comparison of disparate indicators across ABIX dimensional score pillars.

ABIX Comfort Benchmark: Score 0 (Pire de la place) à 100 (Leader de la place)

Concrete example: 2024 data, ABIX 2025 edition, Cost-to-Income (inverted direction): Min = 28.0%, Max = 78.0%. A bank with 38.0% CIR receives a normalized score of $[(78.0 - 38.0) / (78.0 - 28.0)] \times 100 = 80.0 / 100$.

ABIX Modules: Scores ABIX (4 Dimensions), Matrice 4 Quadrants, Profil Banque

SECTOR & MARKET ANALYSIS

Market Share (PDM)

Unit: % | ♦ Contextual interpretation

Percentage held by a single bank across an aggregate relative to total consolidated sector volume.

Measures commercial footprint and competitive positioning across financial aggregates (Assets, Deposits, Loans, NBI). ABIX note: Market share is an indicator of relative scale, not an intrinsic measure of profitability or efficiency (contextual reading direction ♦).

ABIX FORMULA:

Part de Marché = $(\text{Valeur de la Banque} \div \text{Total Consolidé du Secteur}) \times 100$

Interpretation: High market share provides economies of scale, but does not inherently guarantee superior unit profitability.

Concrete example: 2024 data, ABIX 2025 edition, Total Assets (20 banks): Market leader holds approx. 24.5% market share, with public banks aggregating ~87%.

ABIX Modules: Parts de Marché, Vue Secteur, Classements, Profil Banque, Concentration

Market Share Delta (Gain / Loss) (DELTA_PDM)

Unit: pts de % | ♦ Contextual interpretation

Absolute difference in percentage points between market share at period t and period t-1.

Measures net competitive momentum and market share shifts among banks. A market share gain indicates the bank outgrew the overall sector on that metric.

ABIX FORMULA:

Δ Part de Marché = $\text{Part de Marché}_t - \text{Part de Marché}_{t-1}$ (en points de pourcentage)

Interpretation: Sustained share gains reflect aggressive commercial conquest. Share loss indicates commercial slowdown or deliberate de-risking.

Concrete example: 2024 vs 2023 data, ABIX 2025 edition: A bank expanding loan market share from 3.20% to 3.55% records a net gain of +0.35 pts.

ABIX Modules: Parts de Marché, Historique, Profil Banque, Vue Secteur

Public vs Private Sector Segmentation (PUB_PRIV)

Unit: % / Mds DZD | ♦ Contextual interpretation

Institutional classification of banks according to ownership structure (State-owned vs Private lenders).

Distinguishes the 6 major state-owned commercial banks (plus CNEP-Banque) from the 14 private lenders (international subsidiaries, regional and Islamic banks). Central to ABIX for analyzing structural divergences.

ABIX FORMULA:
Agrégat Public = Σ Banques Publiques | Agrégat Privé = Σ Banques Privées

Interpretation: Isolates the massive public bank balance sheet dominance (~87%) alongside private banks' relative profitability dynamism.

Concrete example: 2024 data, ABIX 2025 edition (20 banks): Public sector holds 86.8% of assets and 88.4% of deposits, while private banks generate over 28% of total net income.

ABIX Modules: Public vs Privé, Vue Secteur, Compareur, Parts de Marché

Constant Scope vs Observed Scope (SCOPE)

Unit: banques (effectif) | ♦ Contextual interpretation

Filtering method ensuring only banks with uninterrupted financial reporting across the full timeline are included in multi-year aggregates.

ABIX offers two scope modes: 1) Observed Scope (all reporting banks for a given year); 2) Constant Scope (strictly banks with complete data from start to end year), eliminating distortion in CAGR and Base 100 metrics.

ABIX FORMULA:
Périmètre Constant = { Banques présentes sur chaque année de [Année_début ; Année_fin] }

Interpretation: Essential for mathematical integrity in multi-year trend analysis, CAGR, and indexed trajectories.

Concrete example: 2020-2024 data, ABIX 2025 edition: 5-year constant scope retains the 19 continuously active banks, ensuring 100% consistent sector CAGR.

ABIX Modules: Historique, Séries Temporelles, Scores ABIX (Dynamique), Vue Secteur

CONCENTRATION & COMPETITION

Herfindahl-Hirschman Index (HHI) (HHI)

Market Reference | Unit: points (0 à 10 000) | ♦ Contextual interpretation

Sum of squared market shares of all operating banks, measuring sector concentration on a 0 to 10,000 scale.

HHI squares market shares, placing greater weight on top banks. Standard competitive reading grid (indicative DOJ/FTC benchmarks): 1) HHI < 1,000: Unconcentrated market; 2) 1,000 ≤ HHI ≤ 1,800: Moderately concentrated; 3) HHI > 1,800: Highly concentrated. Mandatory ABIX note: These thresholds constitute a standardized competitive analytical grid and do not represent an automatic legal qualification of the Algerian banking market.

ABIX FORMULA:

$$HHI = \sum (Part\ de\ Marché_i)^2 \text{ (pour } i = 1 \text{ à } N \text{ banques, parts exprimées en \%)}$$

Interpretation: A high HHI (> 1,800) characterizes an oligopolistic structure where a small group of banks commands the majority of deposits and lending.

ABIX Comfort Benchmark: HHI < 1000: Peu concentré | 1000-1800: Modéré | > 1800: Fortement concentré (Grille concurrentielle indicative)

Concrete example: 2024 data, ABIX 2025 edition, Total Assets (20 banks): Sector HHI stands at approx. 1,920 points, characterizing a highly concentrated market by international standards.

ABIX Modules: Concentration & Concurrence, Vue Secteur, Parts de Marché

Concentration Ratios (CR3 & CR5) (CR3_CR5)

Market Reference | Unit: % | ♦ Contextual interpretation

Cumulative market share command held by the top 3 (CR3) or top 5 (CR5) leading banks on a financial metric.

Concentration ratios measure top-tier market command. General definition: CR3 = sum of market shares of the top 3 ranked banks; CR5 = sum of market shares of the top 5 banks for the selected metric and year. ABIX note: Bank rankings are dynamic and computed per year and indicator. Specific bank names appear exclusively in dated historical examples.

ABIX FORMULA:

$$CR3 = Part_1 + Part_2 + Part_3 \mid CR5 = Part_1 + Part_2 + Part_3 + Part_4 + Part_5 \text{ (parts triées par ordre décroissant)}$$

Interpretation: CR3 > 50% or CR5 > 70% characterizes a market heavily dominated by a tight leadership cohort.

ABIX Comfort Benchmark: CR3 > 50 %: Forte emprise oligopolistique | CR5 > 70 %: Marché très concentré

Concrete example: Dated example — Total Assets 2024, ABIX 2025 edition (20 banks): Top 3 banks (BEA, BNA, CPA) aggregate a CR3 of 52.4%, and top 5 (with BADR and BDL) reach a CR5 of 74.8%.

ABIX Modules: Concentration & Concurrence, Parts de Marché, Vue Secteur

Effective Number of Banks (Equivalent Competitors) (NEFF)

Unit: banques équivalentes | ♦ Contextual interpretation

Theoretical number of equal-sized banks that would generate the same HHI concentration level observed in the market.

Calculated as 10,000 / HHI. It translates concentration into intuitive terms: in a market with 20 nominal banks, an HHI of 2,000 implies the competitive equivalent of only 5 equal-sized competitors.

ABIX FORMULA:

$$Nombre\ Effectif\ de\ Banques = 10\ 000 \div HHI$$

Interpretation: The wider the gap between nominal and effective bank counts, the more pronounced the market asymmetry and top-bank dominance.

Concrete example: 2024 data, ABIX 2025 edition, Total Assets (20 nominal banks): With an HHI of 1,920, the effective competitor count is 5.2 equivalent banks.

ABIX Modules: Concentration & Concurrence, Vue Secteur

ABIX METHODOLOGY & FRAMEWORK

ABIX 4D Assessment Framework (4D_ABIX)

ABIX Benchmark | Unit: scores dimensionnels (0-100) | ♦ Contextual interpretation

Methodological architecture structured across 4 independent analytical pillars: Profitability, Growth & Momentum, Efficiency, and Capitalization.

ABIX 4D Framework assesses banks across four pillars: 1) Profitability (ROE, ROA, Net Margin - 33.3% each); 2) Growth & Momentum (multi-year CAGR across Assets, Loans, NBI, Profit - 25% each); 3) Operational Efficiency (Cost-to-Income, GOI Conversion - 50% each); 4) Accounting Capitalization (Equity/Assets, Equity/Loans - 50% each). Fundamental rule: 4D Framework enforces multidimensional profiling to prevent a single composite score from concealing specific bank vulnerabilities. ABIX explicitly avoids monolithic single ratings.

ABIX FORMULA:
4 Scores indépendants (0-100) : Score_Rentabilité + Score_Croissance + Score_Efficience + Score_Capitalisation

Interpretation: Enables radar mapping and positioning matrices to instantly spot structural imbalances (e.g. rapid growth with lagging capital cushion).

ABIX Comfort Benchmark: Lecture multidimensionnelle par pilier (sans note composite globale artificielle)

Concrete example: 2024 data, ABIX 2025 edition: A leading private lender exhibiting top Profitability (88/100) and Efficiency (92/100) combined with moderate Growth (64/100).

ABIX Modules: Scores ABIX (4D), Profils Multidimensionnels, Matrice 4 Quadrants, Executive Dashboard

Deterministic Rule-Based Scanning (SCAN)

ABIX Benchmark | Unit: règles & alertes | ♦ Contextual interpretation

Automated, 100% traceable audit engine identifying trend breaks, balance sheet divergences, and material benchmark gaps.

Deterministic scanning applies transparent, versioned rules (v1.0) directly to financial metrics without black-box modeling. Implemented rules in ABIX: 1) Benchmark gap: absolute gap ≥ 5.0 pts; 2) Notable annual variation: YoY change $\geq 15\%$ (or ratio point change ≥ 5.0 pts); 3) Dimension quartile shift (score change ≥ 10 pts); 4) Activity divergence alerts: a) Deposits vs Loans growth gap ≥ 10 pts; b) NBI up $\geq 15\%$ with Net Profit down $\leq -10\%$; c) Assets up $\geq 10\%$ with ROE down ≤ -2 pts; d) Net provision surge $\geq +30\%$.

ABIX FORMULA:
Règles déterministes d'alerte : $|\Delta \text{ Ratio}| \geq 5 \text{ pts}$ | $\text{YoY} \geq 15 \%$ | $\Delta \text{ Dépôts} - \Delta \text{ Crédits} \geq 10 \text{ pts}$ | $\Delta \text{ Provisions} \geq 30 \%$

Interpretation: Guarantees complete mathematical auditability of analytical insights displayed in executive dashboards and bank profiles.

ABIX Comfort Benchmark: Règles arithmétiques de détection versionnées v1.0 (100 % traçable)

Concrete example: 2024 data, ABIX 2025 edition: Automatic divergence alert triggered for a bank whose deposits grew +18.5% while loans only expanded +4.2% (gap = 14.3 pts ≥ 10 pts threshold).

ABIX Modules: Executive Dashboard, Insights & Alertes, Profil Banque (Synthèse)

E-Banking & Digital Transformation Barometer (EBANK)

ABIX Benchmark | Unit: score (0 à 100) | ▲ Higher generally better

Benchmarking framework evaluating bank digital maturity through auditing mobile apps, web platforms, and e-payment services.

The ABIX E-Banking Barometer is an independent benchmarking tool evaluating digital banking across Algeria. It audits over 40 criteria spanning mobile app functionality, online banking, e-payment capabilities, and UX design.

ABIX FORMULA:
Score E-Banking = $\sum$ (Pondération_dimension × Score_dimension) (sur une échelle normalisée de 0 à 100)

Interpretation: A top score reflects a mature, seamless, and secure digital banking offering for retail and corporate clients.

ABIX Comfort Benchmark: Score 0-100 normalisé sur grille multicritère audité

Concrete example: ABIX Barometer 2025 edition: Bank scores ranging from 32/100 (basic features) to over 86/100 for leading digital pioneers.

ABIX Modules: Baromètre E-Banking, Profil Banque (Volet Digital), Classements Digitaux
