

ABIX GLOSSARY & METHODOLOGY REFERENCE

Algerian banking - 2026 closure edition

Reference synchronized with the ABIX Data Explorer application. Statuses distinguish imported data, ABIX calculations, methodology, educational concepts and unavailable items.

67 concepts	5 calculation statuses	FR / EN aligned
----------------	---------------------------	--------------------

ABIX provides a descriptive and comparative reading of available data. This document is neither a prudential rating nor financial advice.

01. Total Assets (Balance Sheet Total) (TB)

Unit: Mds DZD | ID: total-bilan

Definition

Total Assets represents total closing accounting assets. In ABIX Data Explorer, it serves as the benchmark aggregate for market share calculations, bank size grouping, and sector weighting.

Formula

Total Bilan = Caisse & Banques centrales + Titres & Bons du Trésor + Crédits clientèle + Autres actifs

Interpretation

An indicator of relative size and institutional presence. It does not by itself measure profitability or solvency.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Consolidated sector total assets of approx. 18,500 billion DZD, ~87% held by public banks.

Modules: Vue Secteur - Classements - Profil Banque - Historique - Parts de marché - Executive Dashboard

02. Customer Deposits (DEP)

Unit: Mds DZD | ID: depots-clientele

Definition

Customer deposits aggregate demand, term, savings, and collateral deposits from households, corporates, and institutions. They represent the primary funding base for intermediation.

Formula

Dépôts = Dépôts à vue + Dépôts à terme + Livrets d'épargne + Autres dépôts clientèle

Interpretation

Measures funding capture and customer loyalty. A high share of demand deposits lowers overall cost of funding.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Total deposit volume of 14,200 billion DZD.

Modules: Vue Secteur - Classements - Profil Banque - Historique - Parts de marché - Comparateur

03. Customer Loans (CRE)

Unit: Mds DZD | ID: credits-clientele

Definition

Represents total gross lending facilities extended by the bank across overdrafts, corporate working capital, equipment loans, mortgages, and consumer credit.

Formula

Crédits = Crédits d'exploitation + Crédits d'investissement + Crédits immobiliers + Crédits aux particuliers

Interpretation

Reflects the bank's active contribution to economic financing and counterparty risk exposure.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Gross customer loans of 11,100 billion DZD.

Modules: Vue Secteur - Classements - Profil Banque - Historique - Parts de marché - Comparateur

04. Accounting Equity (FP)

Unit: Mds DZD | ID: fonds-propres

Definition

Accounting Equity represents the net book value on the balance sheet. It acts as the financial cushion against unexpected losses. ABIX note: book equity is distinct from regulatory capital (Tier 1/Tier 2) under Bank of Algeria Regulation 2014-01.

Formula

Fonds Propres = Capital social + Primes d'émission + Réserves + Report à nouveau + Résultat net

Interpretation

A high equity buffer enhances financial autonomy and shock absorption capacity.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector accounting equity of 2,450 billion DZD.

Modules: Vue Secteur - Profil Banque - Classements - Scores ABIX (Solidité financière)

05. Net Banking Income (PNB)

Unit: Mds DZD | ID: produit-net-bancaire

Definition

NBI is the banking equivalent of gross revenue. It consists of net interest income, net fee and commission income, and net trading and FX gains.

Formula

PNB = (Intérêts reçus – Intérêts versés) + (Commissions reçues – Commissions payées) + Gains de change & titres

Interpretation

Reflects commercial dynamism and the bank's capacity to monetize intermediation and payment services.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector Net Banking Income of 430 billion DZD.

Modules: Vue Secteur - Profil Banque - Classements - Scores ABIX (Dynamique) - Historique

06. Gross Operating Income (RBE)

Unit: Mds DZD | ID: resultat-brut-exploitation

Definition

GOI measures the pure operational profitability before credit risk provisions and non-recurring items. It equals NBI minus operating costs and depreciation.

Formula

RBE = Produit Net Bancaire – Frais généraux d'exploitation – Dotations aux amortissements

Interpretation

A solid and growing GOI demonstrates disciplined cost management relative to commercial revenue.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector Gross Operating Income of 245 billion DZD.

Modules: Vue Secteur - Profil Banque - Classements - Scores ABIX (Efficience)

07. Net Profit (Net Income) (RN)

Unit: Mds DZD | ID: resultat-net

Definition

Net Income represents final net earnings after cost of risk (loan provisions), corporate income tax (IBS), and non-operating gains/losses.

Formula

Résultat Net = RBE – Coût net du risque (Provisions nettes) + Résultat exceptionnel – Impôts (IBS)

Interpretation

Ultimate measure of financial return. It directly builds equity through retained earnings or funds dividend distribution.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Consolidated sector net profit of 185 billion DZD.

Modules: Vue Secteur - Profil Banque - Classements - Scores ABIX (Rentabilité) - Historique

08. Treasury Securities & Sovereign Bonds (BT)

Unit: Mds DZD | ID: bons-du-tresor

Definition

Includes short-term and medium/long-term sovereign paper issued by the State Treasury. In Algeria, Treasury paper represents a core asset allocation pillar. Prudential note: Sovereign exposures may benefit from preferential prudential treatment in accordance with applicable regulatory frameworks and qualifying criteria.

Formula

Bons du Trésor = Bons du Trésor à Court Terme + Bons du Trésor à Moyen et Long Terme + Titres assimilés

Interpretation

A high share reflects a conservative asset allocation strategy or surplus liquidity invested in sovereign debt.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector Treasury securities portfolio of 3,800 billion DZD.

Modules: Vue Secteur - Profil Banque - Classements - Historique - Allocation d'actifs

09. Return on Equity (ROE) (ROE)

Calculation status: Imported data | Unit: % | ID: return-on-equity

Definition

ABIX Data Explorer does not recalculate ROE: it preserves the value published or imported from the annual source. The exact denominator may therefore follow the source convention (average, closing, or adjusted equity). Verify that definition in the source document; ROAE remains a separate educational concept.

Formula

ROE = valeur publiée/importée (convention du document source)

Interpretation

A higher ROE reflects strong financial profitability, but must be evaluated alongside leverage and underlying risk profile.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector median ROE of 9.8%, ranging from 3.5% to over 22%.

Modules: Vue Secteur - Classements - Profil Banque - Scores ABIX (Rentabilité) - Matrice Rentabilité vs Risque

10. Return on Average Equity (ROAE) (ROAE)

Calculation status: Not currently available | Unit: % | ID: return-on-average-equity

Definition

Educational concept: ROAE would use average opening and closing equity. ABIX does not currently calculate it or display ROAE values in bank profiles.

Formula

$$\text{ROAE} = [\text{Résultat Net} \div ((\text{Fonds Propres t} + \text{Fonds Propres t-1}) \div 2)] \times 100$$

Interpretation

Preferred for rigorous multi-year analysis when material intra-year equity changes occur.

Example

Educational example only: a calculation using average equity is not a published ABIX value.

Modules: Glossaire pédagogique

11. Return on Assets (ROA) (ROA)

Calculation status: Calculated by ABIX | Unit: % | ID: return-on-assets

Definition

In ABIX Data Explorer, ROA is computed on closing balance sheet assets as of December 31. It measures the bank's ability to generate earnings per unit of asset managed.

Formula

$$\text{ROA} = (\text{Résultat Net} \div \text{Total Bilan de clôture}) \times 100$$

Interpretation

A key indicator of operational profitability. In banking, a ROA above 1.5% reflects strong underlying earning power.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector average ROA of 1.12%, with peaks above 2.5% among private specialized institutions.

Modules: Vue Secteur - Classements - Profil Banque - Scores ABIX (Rentabilité) - Matrice 4 Quadrants

12. Return on Average Assets (ROAA) (ROAA)

Calculation status: Not currently available | Unit: % | ID: return-on-average-assets

Definition

Educational concept: ROAA would use average opening and closing assets. ABIX does not currently calculate it or display ROAA values in bank profiles.

Formula

$$\text{ROAA} = [\text{Résultat Net} \div ((\text{Total Bilan t} + \text{Total Bilan t-1}) \div 2)] \times 100$$

Interpretation

International benchmark standard to neutralize year-end balance sheet seasonality.

Example

Educational example only: a calculation using average assets is not a published ABIX value.

Modules: Glossaire pédagogique

13. Cost-to-Income Ratio (CIR) (CIR)

Unit: % | ID: coefficient-exploitation

Definition

The CIR measures operational efficiency. A lower ratio indicates higher operational productivity in converting revenues to gross profit. In ABIX scoring models, it operates as an inverted metric (lower is better).

Formula

$$\text{Coefficient d'Exploitation} = [(\text{Frais généraux} + \text{Amortissements}) \div \text{Produit Net Bancaire}] \times 100$$

Interpretation

A lower ratio reflects lean operations. A ratio above 60-65% indicates elevated structural overhead.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector median CIR of 43.5%, top-tier efficient banks standing below 35%.

Modules: Vue Secteur - Classements - Profil Banque - Scores ABIX (Efficience) - Historique

14. Net Interest Margin (NIM) (NIM)

Unit: % | ID: marge-interet-nette

Definition

NIM measures the core spread profitability of financial intermediation. ABIX methodology note: Where detailed average earning assets are not homogeneously reported across all banks, ABIX applies the NBI / Total Assets proxy ratio.

Formula

$$\text{NIM théorique} = (\text{Marge d'intérêt nette} \div \text{Actifs productifs moyens}) \times 100 \mid \text{Proxy ABIX} = (\text{PNB} \div \text{Total Bilan}) \times 100$$

Interpretation

A healthy margin reflects loan pricing discipline combined with low-cost customer funding.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector average NBI / Total Assets proxy of 2.35%.

Modules: Vue Secteur - Profil Banque - Historique

15. Net Profit Margin on NBI (NPM)

Unit: % | ID: marge-nette-pnb

Definition

Net Profit Margin assesses the overall capacity of the bank to retain revenues after operating costs, loan impairment provisions, and corporate taxes.

Formula

$$\text{Marge Nette sur PNB} = (\text{Résultat Net} \div \text{Produit Net Bancaire}) \times 100$$

Interpretation

A higher margin indicates a highly profitable and resilient operating model.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector median net profit margin of 42.8%.

Modules: Vue Secteur - Profil Banque - Scores ABIX (Rentabilité)

16. GOI to Net Profit Conversion Rate (RBE_RN)

Calculation status: Calculated by ABIX | Unit: % | ID: conversion-rbe-rn

Definition

This indicator compares two reported accounting aggregates. The gap between GOI and net profit may reflect cost of risk, taxation and non-operating items; the ratio alone does not establish causality.

Formula

Taux de Conversion RBE → RN = (Résultat Net ÷ RBE) × 100

Interpretation

Read over time and with available components. A change describes a different accounting conversion, without an automatic causal diagnosis.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector median conversion rate of 75.5%.

Modules: Vue Secteur - Profil Banque - Scores ABIX (Efficience)

17. Capital Adequacy Ratio (CAR) (CAR)

Unit: % | ID: ratio-solvabilite

Definition

Measures the prudential capital cushion against risk-weighted assets. Algerian regulatory framework: Pursuant to Bank of Algeria Regulation No. 2014-01 of February 16, 2014, mandatory requirements are: 1) Minimum global capital adequacy ratio: at least 9.5% of risk-weighted assets; 2) Tier 1 capital: at least 7.0% of risk-weighted assets. ABIX comfort benchmark: An indicative comfort range in the local market is generally situated between 14% and 18%.

Formula

Ratio de Solvabilité = (Fonds Propres Réglementaires Globaux ÷ Actifs Pondérés par les Risques) × 100

Interpretation

A ratio exceeding the 9.5% legal minimum confirms regulatory compliance. A very high ratio (> 20%) ensures maximum safety but may signal under-deployed credit capacity.

Example

2024 data, ABIX 2025 edition: Sector average CAR estimated at ~16.2%, well above the 9.5% regulatory floor.

Modules: Vue Secteur - Profil Banque - Scores ABIX (Solvabilité) - Fiche Prudentielle

18. Tier 1 Capital Ratio (Tier1)

Unit: % | ID: tier-1-ratio

Definition

Tier 1 ratio evaluates the bank's capacity to absorb immediate losses on a going-concern basis. Algerian regulation: BA Regulation No. 2014-01 mandates a minimum Tier 1 capital ratio of 7.0% of risk-weighted assets.

Formula

Ratio Tier 1 = (Fonds Propres de Base Tier 1 ÷ Actifs Pondérés par les Risques) × 100

Interpretation

A strong Tier 1 ratio ensures long-term viability without requiring emergency capital injections in stress scenarios.

Example

2024 data, ABIX 2025 edition: Average Tier 1 ratio of major Algerian banks estimated above 13.5%, compliant with regulations.

Modules: Profil Banque - Fiche Prudentielle

19. Non-Performing Loans Ratio (NPL Ratio) (NPL)

Calculation status: Not currently available | Unit: % | ID: taux-npl

Definition

Educational asset-quality concept. ABIX does not currently calculate or display this ratio because homogeneous gross NPL balances are unavailable for all banks.

Formula

$$\text{Taux NPL} = (\text{Créances Non Performantes brutes} \div \text{Encours Total des Crédits bruts}) \times 100$$

Interpretation

The formula is educational only; ABIX produces no NPL value, performance direction or NPL alert.

Example

No ABIX numerical example: the required data are not homogeneously available.

Modules: Glossaire pédagogique

20. NPL Coverage Ratio (COV)

Calculation status: Not currently available | Unit: % | ID: taux-couverture-npl

Definition

Educational concept. ABIX does not currently calculate or display this ratio because homogeneous impairment-provision stocks and NPL balances are unavailable for all banks.

Formula

$$\text{Taux de Couverture} = (\text{Stock de Provisions pour Dépréciation} \div \text{Encours Brut des NPL}) \times 100$$

Interpretation

The formula is educational only; ABIX produces no coverage benchmark or coverage assessment.

Example

Methodological example: For 50B DZD in impaired loans with 40B DZD in cumulative provisions, the coverage ratio stands at 80.0%.

Modules: Glossaire pédagogique

21. Provisioning Effort to Loans (Cost of Risk Proxy) (PROV_CRE)

Calculation status: Calculated by ABIX | Unit: % | ID: effort-provisionnement

Definition

ABIX divides the available annual net-provision flow by outstanding loans. This contextual measure is neither an NPL ratio nor a coverage ratio and does not by itself prove portfolio deterioration.

Formula

$$\text{Effort de Provisionnement} = (\text{Dotations Nettes aux Provisions} \div \text{Encours des Prêts}) \times 100$$

Interpretation

Read together with the amount, its trend and other available aggregates. A high or low level is not automatically favorable or unfavorable.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector median provisioning effort of 0.55% of total loans.

Modules: Vue Secteur - Profil Banque - Scores ABIX (Risque) - Historique

22. Cost-of-Risk Weight in NBI (CDR_PNB)

Calculation status: Calculated by ABIX | Unit: % | ID: cout-risque-pnb

Definition

ABIX's official cost-of-risk materiality indicator: it retains the provision amount, its annual change and its weight in NBI. It replaces neither the NPL ratio nor the coverage ratio and cannot establish causality on its own.

Formula

$$\text{Poids du Coût du Risque} = (\text{Dotations Nettes aux Provisions} \div \text{PNB}) \times 100$$

Interpretation

Contextual reading by amount, trend and gap to an available reference. A raw increase in provisions does not trigger an ABIX alert by itself.

Example

Methodological example: DZD 5bn of net provisions over DZD 50bn of NBI gives a 10.0% weight. Interpretation also retains the amount and benchmark.

Modules: Vue Secteur - Profil Banque - Executive Dashboard - Historique

23. Provision Burden on Gross Operating Income (PROV_RBE)

Calculation status: Calculated by ABIX | Unit: % | ID: pression-provision-rbe

Definition

Divides the available annual net-provision flow by GOI. A change may reflect several accounting or economic factors; ABIX does not automatically infer borrower-risk deterioration.

Formula

$$\text{Pression Provisions / RBE} = (\text{Dotations Nettes aux Provisions} \div \text{RBE}) \times 100$$

Interpretation

Contextual reading: compare the ratio over time and with a sufficiently large group, while retaining the provision amount and GOI level.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector median provision burden on GOI of 18.4%.

Modules: Vue Secteur - Profil Banque - Scores ABIX (Efficience & Risque)

24. Equity to Total Assets (Financial Strength) (FP_TB)

Calculation status: Calculated by ABIX | Unit: % | ID: fonds-propres-total-bilan

Definition

Accounting measure of financial backing, dividing reported equity by total assets. It does not replace a regulatory solvency ratio based on risk-weighted assets (RWA).

Formula

$$\text{Fonds Propres / Total Bilan} = (\text{Fonds Propres Comptables} \div \text{Total Bilan}) \times 100$$

Interpretation

Within the ABIX Financial Strength dimension, a higher ratio means greater relative accounting backing; this remains distinct from prudential compliance.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector average ratio of 13.2%, reflecting strong equity backing.

Modules: Vue Secteur - Profil Banque - Scores ABIX (Solidité financière) - Classements

25. Accounting Leverage (Assets / Equity) (LEV)

Unit: x | ID: levier-financier

Definition

Measures balance sheet asset scale relative to equity backing. ABIX note: This is a simplified accounting leverage multiple and does not constitute the Basel III regulatory leverage ratio (which includes off-balance sheet items and prudential deductions).

Formula

$$\text{Lever Comptable} = \text{Total Bilan} \div \text{Fonds Propres Comptables}$$

Interpretation

A moderate leverage (6x to 9x) ensures strong safety. Elevated leverage (> 15x) heightens solvency vulnerability.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector median accounting leverage of 7.6x.

Modules: Vue Secteur - Profil Banque - Comparateur

26. Loan-to-Deposit Ratio (LDR) (LDR)

Unit: % | ID: ratio-prets-depots

Definition

The LDR measures the bank's financial intermediation depth. It compares net loans to customer deposits. A balanced ratio ensures that lending is funded by stable customer deposits without excessive reliance on wholesale funding.

Formula

$$\text{Ratio Prêts / Dépôts} = (\text{Crédits Nets à la Clientèle} \div \text{Dépôts de la Clientèle}) \times 100$$

Interpretation

An LDR between 70% and 90% indicates balanced intermediation. Below 60%, resources are under-deployed; above 100%, the bank relies on external funding.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector average LDR of 78.2%, reflecting solid deposit backing.

Modules: Vue Secteur - Profil Banque - Comparateur - Historique

27. Loans to Total Assets (CRE_TB)

Unit: % | ID: prets-total-actif

Definition

Reflects the bank's asset allocation profile. A high loan share characterizes a commercial lending bank, whereas a lower share indicates a sovereign paper or cash management focus.

Formula

$$\text{Prêts / Total Bilan} = (\text{Encours des Crédits Clientèle} \div \text{Total Bilan}) \times 100$$

Interpretation

Measures core lending intensity. A higher ratio correlates with greater revenue sensitivity to private credit risk.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector average loan share of total assets of 60.0%.

Modules: Vue Secteur - Profil Banque - Allocation d'actifs - Comparateur

28. Treasury Securities to Total Assets (BT / bilan)

Unit: % | ID: bdt-total-actif

Definition

Measures the sovereign allocation weight within the asset base. Historically in Algeria, public banks hold material Treasury securities volumes from balance sheet restructuring and liquidity placements.

Formula

$$\text{BDT} / \text{Total Bilan} = (\text{Encours des Bons du Trésor} \div \text{Total Bilan}) \times 100$$

Interpretation

A high ratio secures liquidity and sovereign coupon income, but may reflect relative crowding-out of private sector credit.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Average Treasury securities share of 20.5% of sector total assets.

Modules: Vue Secteur - Profil Banque - Allocation d'actifs

29. Deposits to Total Assets (Liabilities) (DEP_TB)

Unit: % | ID: depots-total-passif

Definition

Measures the bank's structural reliance on customer deposits compared to other funding sources (equity, interbank borrowing, bond issues).

Formula

$$\text{Dépôts} / \text{Total Bilan} = (\text{Dépôts de la Clientèle} \div \text{Total Bilan}) \times 100$$

Interpretation

A share above 75-80% characterizes a traditional commercial retail banking model with a granular, stable funding base.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector average deposit share of 76.8% of total liabilities.

Modules: Vue Secteur - Profil Banque - Historique

30. Other Assets (Residual Balance) (AA)

Unit: Mds DZD | ID: autres-actifs

Definition

In ABIX balance sheet allocation models, Other Assets is the residual balance (Total Assets minus Loans minus Treasury Securities), encompassing cash, central bank reserves, interbank placements, fixed assets, and sundry accounts.

Formula

$$\text{Autres Actifs} = \text{Total Bilan} - \text{Prêts clientèle} - \text{Bons du Trésor}$$

Interpretation

Enables full 100% balance sheet decomposition (Loans + Treasury + Other = 100%). A negative value flags potential data inconsistency.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector other assets volume of ~3,600 billion DZD (~19.5% of total assets).

Modules: Vue Secteur - Profil Banque - Allocation d'actifs

31. Liquidity Coverage Ratio (LCR) (LCR)

Unit: % | ID: ratio-lcr

Definition

Compares high-quality liquid assets (HQLA) readily convertible to central bank cash against estimated 30-day net cash outflows under severe stress. Standard requirement: Minimum 100%.

Formula

$$\text{LCR} = (\text{Stock d'Actifs Liquides de Haute Qualité HQLA} \div \text{Sorties Nettes de Trésorerie à 30j}) \times 100$$

Interpretation

An LCR above 100% ensures the bank holds sufficient liquid buffers to withstand deposit run-offs without emergency aid.

Example

Normative example: For 120B DZD in HQLA and 80B DZD in 30-day modeled net outflows, LCR is 150% (exceeding 100% minimum).

Modules: Fiche Prudentielle - Comparateur

32. Net Stable Funding Ratio (NSFR) (NSFR)

Unit: % | ID: ratio-nsfr

Definition

NSFR limits excessive reliance on short-term wholesale funding to finance long-term assets. It divides available stable funding (ASF) by required stable funding (RSF). Prudential standard: Minimum 100%.

Formula

$$\text{NSFR} = (\text{Montant de Financement Stable Disponible ASF} \div \text{Financement Stable Exigé RSF}) \times 100$$

Interpretation

An NSFR above 100% confirms that long-term illiquid assets are funded by durable, sticky equity and deposits.

Example

Methodological example: 200B DZD ASF covering 160B DZD RSF yields a solid 125% NSFR.

Modules: Fiche Prudentielle - Comparateur

33. Arithmetic Mean (Average) (MOY)

Unit: selon indicateur | ID: moyenne-arithmetique

Definition

The arithmetic mean measures central tendency. In ABIX Data Explorer, it is computed strictly on available numeric observations (excluding nulls). It can be sensitive to extreme outliers in highly concentrated banking systems.

Formula

$$\text{Moyenne} = (\sum X_i) \div N \text{ (pour } i = 1 \text{ à } N)$$

Interpretation

Provides the overall market level, but should be compared with the median to assess distributional skewness.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Sector mean ROE is 11.4% vs median of 9.8% (positive skew driven by top performers).

Modules: Vue Secteur - Classements - Profil Banque - Distribution Sectorielle

34. Median (50th Percentile / Q2) (MED)

Unit: selon indicateur | ID: mediane

Definition

The median is ABIX's primary robust central tendency metric because it is fully resistant to extreme outliers and public bank scale distortions. Exact formulation: 1) For an odd number N of banks (e.g. 21 banks in 2026): Median = central value at rank $(N+1)/2$; 2) For an even number N of banks (e.g. 20 banks in 2025): Median = arithmetic average of the two central values at ranks $N/2$ and $(N/2)+1$.

Formula

Si N impair : Médiane = $X_{((N+1)/2)}$ | Si N pair : Médiane = $(X_{(N/2)} + X_{(N/2 + 1)}) \div 2$

Interpretation

Represents the performance of a typical median bank in Algeria without weighting bias towards giant public banks.

Example

2024 data, ABIX 2025 edition (20 banks, even N): Median CIR is the average of the 10th bank (43.2%) and 11th bank (43.8%), exactly 43.5%.

Modules: Vue Secteur - Classements - Profil Banque - Benchmarks & Quartiles - Executive Summary

35. Quartiles & Percentiles (Q1, Q2, Q3) (QUART)

Unit: selon indicateur | ID: quartiles

Definition

In descriptive statistics, quartile thresholds are $Q1=P25$, $Q2=P50$ (median), and $Q3=P75$, using $(N-1)*p$ interpolation. ABIX performance bands are a separate, business-direction-aware presentation: ABIX band Q1 identifies the most favorable 25%, while Q4 identifies the least favorable 25%. For Growth Momentum, the same cut-offs are explicitly labelled relative momentum bands and do not imply general performance.

Formula

$Q1 = P25$ (interpolation linéaire) | $Q2 = \text{Médiane } (P50)$ | $Q3 = P75$ (interpolation linéaire)

Interpretation

Positions each bank objectively within its peer distribution tier without mean-driven distortion.

Example

Descriptive example: $Q1=P25$, $Q2=P50$, and $Q3=P75$. In a direction-aware ROE view, values above P75 separately carry the label 'ABIX performance band Q1'.

Modules: Vue Secteur - Profil Banque - Distribution & Boxplots - Executive Dashboard - Heatmaps

36. Standard Deviation (σ) (SIGMA)

Unit: selon indicateur | ID: ecart-type

Definition

Quantifies the homogeneity or dispersion of banking metrics across institutions. Statistical note: In an approximately normal distribution, ~68% of observations fall within $\pm 1\sigma$ and ~95% within $\pm 2\sigma$ of the mean.

Formula

Écart-type (σ) = $\sqrt{[(1 \div N) \times \sum (X_i - \bar{X})^2]}$

Interpretation

Evaluates mean representativeness and identifies outlier banks lying beyond 2 standard deviations.

Example

2024 data, ABIX 2025 edition, 20-bank scope: For a mean ROE of 11.4% with sector $\sigma = 5.2\%$, the range [6.2% - 16.6%] encompasses the core bank cohort.

Modules: Vue Secteur - Distribution Sectorielle - Outliers & Détection d'Anomalies

37. Coefficient of Variation (CV) (CV)

Unit: % | ID: coefficient-variation

Definition

The CV is a dimensionless metric enabling direct dispersion comparison across financial indicators with different units or scales (e.g. comparing deposits dispersion in billion DZD with ROE dispersion in %).

Formula

Coefficient de Variation (CV) = $(\text{Écart-type } \sigma \div \text{Moyenne arithmétique } X) \times 100$

Interpretation

CV < 15% indicates strong sector homogeneity. CV > 30-50% indicates high dispersion and structural polarization.

Example

2024 data, ABIX 2025 edition: Cost-to-Income CV is 24% (moderate), whereas Total Assets CV reaches 145% (extreme scale skewness).

Modules: Vue Secteur - Distribution Sectorielle - Comparateur

38. Compound Annual Growth Rate (CAGR) (CAGR)

Unit: % | ID: taux-croissance-annuel-compose

Definition

CAGR smooths out year-to-year volatility through geometric progression. In ABIX Data Explorer, CAGR is used in the Growth scoring pillar (25% weight each on Assets, Loans, NBI, and Net Profit).

Formula

CAGR = $[(\text{Valeur Finale} \div \text{Valeur Initiale})^{(1 \div n)} - 1] \times 100$

Interpretation

Provides a standardized, fair multi-year growth comparison across institutions of varying scale.

Example

2021-2024 data, ABIX 2025 edition (constant scope): Sector loans expanded from 8,500B to 11,100B DZD over 3 years, representing a CAGR of +9.3% per annum.

Modules: Scores ABIX (Dynamique & Croissance) - Historique Pluriannuel - Profil Banque

39. Year-over-Year Growth (YoY / Δ) (YoY)

Unit: % / pts | ID: variation-annuelle-yoy

Definition

Measures annual metric expansion or contraction. In ABIX Data Explorer, for indicators already expressed as percentages (e.g. ROE, CIR), the variation is strictly tracked in percentage points (point_change).

Formula

Pour agrégats (Mds DZD) : YoY = $[(V_t - V_{t-1}) \div V_{t-1}] \times 100$ | Pour ratios (%) : $\Delta = V_t - V_{t-1}$ (en points)

Interpretation

Identifies trend shifts, commercial accelerations, or abrupt year-over-year decelerations.

Example

2024 vs 2023 data, ABIX 2025 edition: Sector NBI grew by +8.2% YoY, while average ROE gained +0.6 percentage points.

Modules: Historique - Profil Banque - Vue Secteur - Scanning Déterministe

40. Rebased Index (Base 100) (B100)

Unit: indice (base 100) | ID: base-100

Definition

Base 100 fixes the initial selected year at 100. Subsequent years are computed as (Year Value / Base Value) * 100. This enables direct graphical trajectory comparison between large public and smaller private lenders.

Formula

$$\text{Indice Base 100 (t)} = (\text{Valeur}_t \div \text{Valeur_base}) \times 100$$

Interpretation

An index of 135 indicates cumulative growth of +35% since the base year, regardless of initial bank size.

Example

2021-2024 data, ABIX 2025 edition (2021 base = 100): In 2024, sector deposits stand at 128.4 (+28.4% cumulative growth).

Modules: Historique - Comparateur - Profil Banque

41. Pearson Linear Correlation (r) (PEARSON)

Unit: coefficient (-1 à +1) | ID: correlation-pearson

Definition

The Pearson coefficient r ranges from -1 (perfect inverse linear relation) to +1 (perfect positive linear relation), with 0 indicating no linear association. Fundamental ABIX rule: Correlation $\neq$ Causation. Furthermore, r measures strictly linear relationships and can be sensitive to extreme outliers.

Formula

$$r = \frac{\sum [(X_i - \bar{X})(Y_i - \bar{Y})]}{\sqrt{\sum (X_i - \bar{X})^2} \times \sqrt{\sum (Y_i - \bar{Y})^2}}$$

Interpretation

$|r| > 0.70$ indicates strong linear correlation; $0.40 < |r| < 0.70$ moderate; $|r| < 0.40$ weak or non-linear association.

Example

2024 data, ABIX 2025 edition, 20-bank scope: Strong positive linear correlation of $r = +0.88$ observed between Customer Deposits and Total Assets.

Modules: Matrice de Corrélation - Nuage de Points (Scatter Plots) - Lab Méthodologique

42. Standardized Z-Score (Relative Positioning) (Z-SCORE)

Unit: score (sans unité) | ID: z-score-standardise

Definition

Standardizes metrics to a unitless scale centered at zero. ABIX implements two variants: 1) Classic $Z = (X - \text{Mean}) / \sigma$; 2) Robust $Z = 0.6745 * (X - \text{Median}) / \text{MAD}$. Statistical note: The equivalence of $Z = +2$ with the top 2.5% holds strictly only under the assumption of a normal distribution.

Formula

$$Z \text{ classique} = (X - \bar{X}) \div \sigma \quad | \quad Z \text{ robuste} = 0,6745 \times (X - \text{Médiane}) \div \text{MAD}$$

Interpretation

$Z = 0$ places the bank at market center. $Z > +2$ or $Z < -2$ flags an outlier significantly diverging from sector norms.

Example

2024 data, ABIX 2025 edition: A bank with 21.8% ROE against a sector mean of 11.4% ($\sigma = 5.2\%$) achieves $Z = +2.00$.

Modules: Outliers & Détection d'Anomalies - Lab Méthodologique - Profil Banque

43. Min-Max Normalization (0-100 Scale) (MINMAX)

Calculation status: Educational concept | Unit: score (0 à 100) | ID: normalisation-min-max

Definition

Statistical concept shown for education and usable as a secondary diagnostic in the laboratory. The four official ABIX dimension scores use empirical percentile ranks within the selected comparison group, not Min-Max normalization.

Formula

Sens direct : $\text{Score} = [(X - \text{Min}) \div (\text{Max} - \text{Min})] \times 100$ | Sens inverse : $\text{Score} = [(\text{Max} - X) \div (\text{Max} - \text{Min})] \times 100$

Interpretation

Useful for understanding linear rescaling, but it is not an official ABIX score.

Example

2024 data, ABIX 2025 edition, Cost-to-Income (inverted direction): Min = 28.0%, Max = 78.0%. A bank with 38.0% CIR receives a normalized score of $[(78.0 - 38.0) / (78.0 - 28.0)] \times 100 = 80.0 / 100$.

Modules: Laboratoire méthodologique - Glossaire pédagogique

44. Market Share (PDM)

Unit: % | ID: part-de-marche

Definition

Measures commercial footprint and competitive positioning across financial aggregates (Assets, Deposits, Loans, NBI). ABIX note: Market share is an indicator of relative scale, not an intrinsic measure of profitability or efficiency (contextual reading direction □).

Formula

Part de Marché = $(\text{Valeur de la Banque} \div \text{Total Consolidé du Secteur}) \times 100$

Interpretation

High market share provides economies of scale, but does not inherently guarantee superior unit profitability.

Example

2024 data, ABIX 2025 edition, Total Assets (20 banks): Market leader holds approx. 24.5% market share, with public banks aggregating ~87%.

Modules: Parts de Marché - Vue Secteur - Classements - Profil Banque - Concentration

45. Market Share Delta (Gain / Loss) (DELTA_PDM)

Unit: pts de % | ID: gain-perte-part-marche

Definition

Measures net competitive momentum and market share shifts among banks. A market share gain indicates the bank outgrew the overall sector on that metric.

Formula

$\Delta \text{ Part de Marché} = \text{Part de Marché}_t - \text{Part de Marché}_{t-1}$ (en points de pourcentage)

Interpretation

Sustained share gains reflect aggressive commercial conquest. Share loss indicates commercial slowdown or deliberate de-risking.

Example

2024 vs 2023 data, ABIX 2025 edition: A bank expanding loan market share from 3.20% to 3.55% records a net gain of +0.35 pts.

Modules: Parts de Marché - Historique - Profil Banque - Vue Secteur

46. Public vs Private Sector Segmentation (PUB_PRIV)

Unit: % / Mds DZD | ID: secteur-public-privé

Definition

Distinguishes the 6 major state-owned commercial banks (plus CNEP-Banque) from the 14 private lenders (international subsidiaries, regional and Islamic banks). Central to ABIX for analyzing structural divergences.

Formula

Agrégat Public = Σ Banques Publiques | Agrégat Privé = Σ Banques Privées

Interpretation

Isolates the massive public bank balance sheet dominance (~87%) alongside private banks' relative profitability dynamism.

Example

2024 data, ABIX 2025 edition (20 banks): Public sector holds 86.8% of assets and 88.4% of deposits, while private banks generate over 28% of total net income.

Modules: Public vs Privé - Vue Secteur - Comparateur - Parts de Marché

47. Constant Scope vs Observed Scope (SCOPE)

Unit: banques (effectif) | ID: perimetre-constant

Definition

ABIX offers two scope modes: 1) Observed Scope (all reporting banks for a given year); 2) Constant Scope (strictly banks with complete data from start to end year), eliminating distortion in CAGR and Base 100 metrics.

Formula

Périmètre Constant = { Banques présentes sur chaque année de [Année_début ; Année_fin] }

Interpretation

Essential for mathematical integrity in multi-year trend analysis, CAGR, and indexed trajectories.

Example

2020-2024 data, ABIX 2025 edition: 5-year constant scope retains the 19 continuously active banks, ensuring 100% consistent sector CAGR.

Modules: Historique - Séries Temporelles - Scores ABIX (Dynamique) - Vue Secteur

48. Herfindahl-Hirschman Index (HHI) (HHI)

Unit: points (0 à 10 000) | ID: indice-hhi

Definition

HHI squares market shares, placing greater weight on top banks. Standard competitive reading grid (indicative DOJ/FTC benchmarks): 1) $HHI < 1,000$: Unconcentrated market; 2) $1,000 \leq HHI \leq 1,800$: Moderately concentrated; 3) $HHI > 1,800$: Highly concentrated. Mandatory ABIX note: These thresholds constitute a standardized competitive analytical grid and do not represent an automatic legal qualification of the Algerian banking market.

Formula

$HHI = \Sigma (\text{Part de Marché}_i)^2$ (pour $i = 1$ à N banques, parts exprimées en %)

Interpretation

A high HHI ($> 1,800$) characterizes an oligopolistic structure where a small group of banks commands the majority of deposits and lending.

Example

2024 data, ABIX 2025 edition, Total Assets (20 banks): Sector HHI stands at approx. 1,920 points, characterizing a highly concentrated market by international standards.

Modules: Concentration & Concurrence - Vue Secteur - Parts de Marché

49. Concentration Ratios (CR3 & CR5) (CR3_CR5)

Unit: % | ID: ratios-cr3-cr5

Definition

Concentration ratios measure top-tier market command. General definition: CR3 = sum of market shares of the top 3 ranked banks; CR5 = sum of market shares of the top 5 banks for the selected metric and year. ABIX note: Bank rankings are dynamic and computed per year and indicator. Specific bank names appear exclusively in dated historical examples.

Formula

$CR3 = Part_1 + Part_2 + Part_3$ | $CR5 = Part_1 + Part_2 + Part_3 + Part_4 + Part_5$ (parts triées par ordre décroissant)

Interpretation

$CR3 > 50\%$ or $CR5 > 70\%$ characterizes a market heavily dominated by a tight leadership cohort.

Example

Dated example — Total Assets 2024, ABIX 2025 edition (20 banks): Top 3 banks (BEA, BNA, CPA) aggregate a CR3 of 52.4%, and top 5 (with BADR and BDL) reach a CR5 of 74.8%.

Modules: Concentration & Concurrence - Parts de Marché - Vue Secteur

50. Effective Number of Banks (Equivalent Competitors) (NEFF)

Unit: banques équivalentes | ID: nombre-effectif-banques

Definition

Calculated as $10,000 / HHI$. It translates concentration into intuitive terms: in a market with 20 nominal banks, an HHI of 2,000 implies the competitive equivalent of only 5 equal-sized competitors.

Formula

$\text{Nombre Effectif de Banques} = 10\,000 \div HHI$

Interpretation

The wider the gap between nominal and effective bank counts, the more pronounced the market asymmetry and top-bank dominance.

Example

2024 data, ABIX 2025 edition, Total Assets (20 nominal banks): With an HHI of 1,920, the effective competitor count is 5.2 equivalent banks.

Modules: Concentration & Concurrence - Vue Secteur

51. ABIX 4D Assessment Framework (4D_ABIX)

Calculation status: ABIX methodology | Unit: scores dimensionnels (0-100) | ID: cadre-4d-abix

Definition

Scores use empirical percentile ranks within the selected comparison group when $N \geq 5$, then dimension weights: Profitability (imported ROE, calculated ROA, net margin; 33.3% each), Growth Momentum (CAGR of assets, loans, NBI and net profit; 25% each), Efficiency (CIR and GOI/net-profit conversion; 50% each), and Financial Strength (equity/assets and equity/loans; 50% each). At least 67% component coverage is required. Dimensions remain separate: ABIX calculates no global score.

Formula

$\text{Profil 4D} = \{\text{Score_Rentabilité}, \text{Score_Growth_Momentum}, \text{Score_Efficience}, \text{Score_Solidité_Financière}\}$ — sans addition globale

Interpretation

Growth Momentum quartiles describe relative momentum (upper, upper-middle, lower-middle or lower) and are not automatically labeled as strengths or weaknesses.

Example

Methodological example: four scores are reported separately with their group, sample size, competition rank and quartile.

Modules: Scores ABIX (4D) - Profils Multidimensionnels - Matrice 4 Quadrants - Executive Dashboard

52. Deterministic Rule-Based Scanning (SCAN)

Calculation status: ABIX methodology | Unit: règles & alertes | ID: scanning-deterministe

Definition

Deterministic scanning applies explicit arithmetic rules to available data: benchmark gaps, changes, dimension shifts and activity divergences. For cost of risk, a raw provision increase—even a very large one—is insufficient: the observation requires a material provisions/NBI weight (absolute value $\geq 10\%$) or an absolute gap to an available benchmark ≥ 5 points, while reporting amount, change and ratio. No free-form generative model is involved.

Formula

Règles déterministes versionnées ; coût du risque : $|\text{Dotations nettes} / \text{PNB}| \geq 10\%$ ou $|\text{écart benchmark}| \geq 5 \text{ pts}$

Interpretation

Guarantees complete mathematical auditability of analytical insights displayed in executive dashboards and bank profiles.

Example

2024 data, ABIX 2025 edition: Automatic divergence alert triggered for a bank whose deposits grew +18.5% while loans only expanded +4.2% (gap = 14.3 pts ≥ 10 pts threshold).

Modules: Executive Dashboard - Insights & Alertes - Profil Banque (Synthèse)

53. E-Banking & Digital Transformation Barometer (EBANK)

Unit: score (0 à 100) | ID: barometre-ebanking

Definition

The ABIX E-Banking Barometer is an independent benchmarking tool evaluating digital banking across Algeria. It audits over 40 criteria spanning mobile app functionality, online banking, e-payment capabilities, and UX design.

Formula

Score E-Banking = $\sum (\text{Pondération}_{\text{dimension}} \times \text{Score}_{\text{dimension}})$ (sur une échelle normalisée de 0 à 100)

Interpretation

A top score reflects a mature, seamless, and secure digital banking offering for retail and corporate clients.

Example

ABIX Barometer 2025 edition: Bank scores ranging from 32/100 (basic features) to over 86/100 for leading digital pioneers.

Modules: Baromètre E-Banking - Profil Banque (Volet Digital) - Classements Digitaux

54. Cost of Risk to NBI Ratio (CdR / PNB)

Unit: % | ID: poids-cout-risque-pnb

Definition

The ratio measures the share of Net Banking Income absorbed by net provision charges. It complements the amount and trend analysis without replacing the NPL ratio, coverage ratio, or a prudential exposure-based risk-cost measure.

Formula

$(\text{Dotations nettes aux provisions} / \text{Produit Net Bancaire}) \times 100$

Interpretation

Contextual reading by amount, trend, and gap to the available consolidated public or private reference. A raw increase in provisions does not, by itself, constitute a performance judgement.

Example

N/A

Modules: Executive V2

55. NBI per Employee (Productivity) (PNB/Effectif)

Unit: M DZD | ID: pnb-par-collaborateur

Definition

See short definition.

Formula

Produit Net Bancaire / Effectif Total Annoncé

Interpretation

Allows for comparison of workforce efficiency between banks with similar models (retail vs corporate).

Example

N/A

Modules: Executive V2

56. Headcount (Number of Employees) (Effectifs)

Unit: collaborateurs | ID: effectifs-bancaires

Definition

The total bank headcount reported by the bank.

Interpretation

Size indicator used primarily as a denominator for productivity ratios.

Example

N/A

Modules: Executive V2

57. Number of Branches (Agences)

Unit: agences | ID: nombre-agences

Definition

The entire physical network of bank branches.

Interpretation

Physical footprint and territorial coverage indicator.

Example

N/A

Modules: Executive V2

58. Off-balance sheet commitments given (EHB Donnés)

Unit: M DZD | ID: engagements-hors-bilan-donnes

Definition

Total amount of commitments taken by the bank in the form of signatures.

Interpretation

Measures signature credit activity.

Example

N/A

Modules: Executive V2

59. Off-balance sheet commitments received (EHB Reçus)

Unit: M DZD | ID: engagements-hors-bilan-recus

Definition

Total amount of guarantee commitments received by the bank.

Interpretation

Portfolio security indicator.

Example

N/A

Modules: Executive V2

60. Net Interest Margin share in NBI (MNI / PNB)

Unit: % | ID: part-marge-interet

Definition

Ratio of net interest margin to global Net Banking Income.

Interpretation

Visualizes the weight of traditional intermediation activity.

Example

N/A

Modules: Executive V2

61. Commissions share in NBI (Commissions / PNB)

Unit: % | ID: part-commissions

Definition

Ratio of net commissions received to global Net Banking Income.

Interpretation

Estimates revenue diversification towards fee-based services.

Example

N/A

Modules: Executive V2

62. Other Income share in NBI (Autres / PNB)

Unit: % | ID: part-autres-revenus

Definition

Ratio of other incomes (financial operations, miscellaneous) to global NBI.

Interpretation

Indicates potential volatility and exceptional incomes.

Example

N/A

Modules: Executive V2

63. Consolidated Ownership Reference (Réf. statut)

Calculation status: ABIX methodology | Unit: % | ID: reference-consolidee-statut

Definition

For risk cost, the reference equals group net provisions divided by group NBI. It is therefore NBI-weighted and is not a median.

Formula

Référence CdR du statut = Σ provisions nettes du groupe / Σ PNB du groupe $\times$ 100

Interpretation

Provides a contextual comparison with banks of the same ownership status, without a regulatory rating or business-model benchmark.

Example

N/A

Modules: Executive V2

64. Growth Momentum (Growth Momentum)

Calculation status: ABIX methodology | ID: dynamique-croissance

Definition

ABIX dimension presenting relative changes in key aggregates. High momentum does not automatically imply better banking quality or overall performance.

Interpretation

Quartiles describe relative growth intensity here, without normative judgement.

Example

N/A

Modules: Executive V2 - Scores ABIX

65. Financial Strength (Financial Strength)

Calculation status: ABIX methodology | ID: solidite-financiere

Definition

This dimension positions the bank using available financial-structure indicators. It is neither a regulatory solvency ratio nor a prudential assessment.

Interpretation

Relative positioning among available institutions, without an overall ABIX score.

Example

N/A

Modules: Executive V2 - Scores ABIX

66. Not available (N/D)

Calculation status: ABIX methodology | ID: non-disponible

Definition

ABIX explicitly preserves this state and never artificially replaces an unavailable value with zero.

Interpretation

A missing value must be interpreted neither as zero nor as underperformance.

Example

N/A

Modules: Executive V2 - Tous modules

67. Not significant (NS)

Calculation status: ABIX methodology | ID: non-significatif

Definition

ABIX explicitly preserves the NS marker; it is never automatically converted to zero or included as a numeric observation.

Interpretation

The value is excluded from calculations requiring a valid numeric observation.

Example

NS

Modules: Executive V2 - Tous modules
